

Smart-CSMS

Charging Station Management System

Smartport Technology developed
rapid charger and control system of Electric Vehicle Charger
through international standard OCPP communication.

Smart-Charging Station Management System

The Smart Charging Station Management System (CSMS) supports the installation and operation of electric vehicle chargers, management of billing information, and remote control of electric vehicle chargers to ensure stable operation and efficient management of electric vehicle chargers.

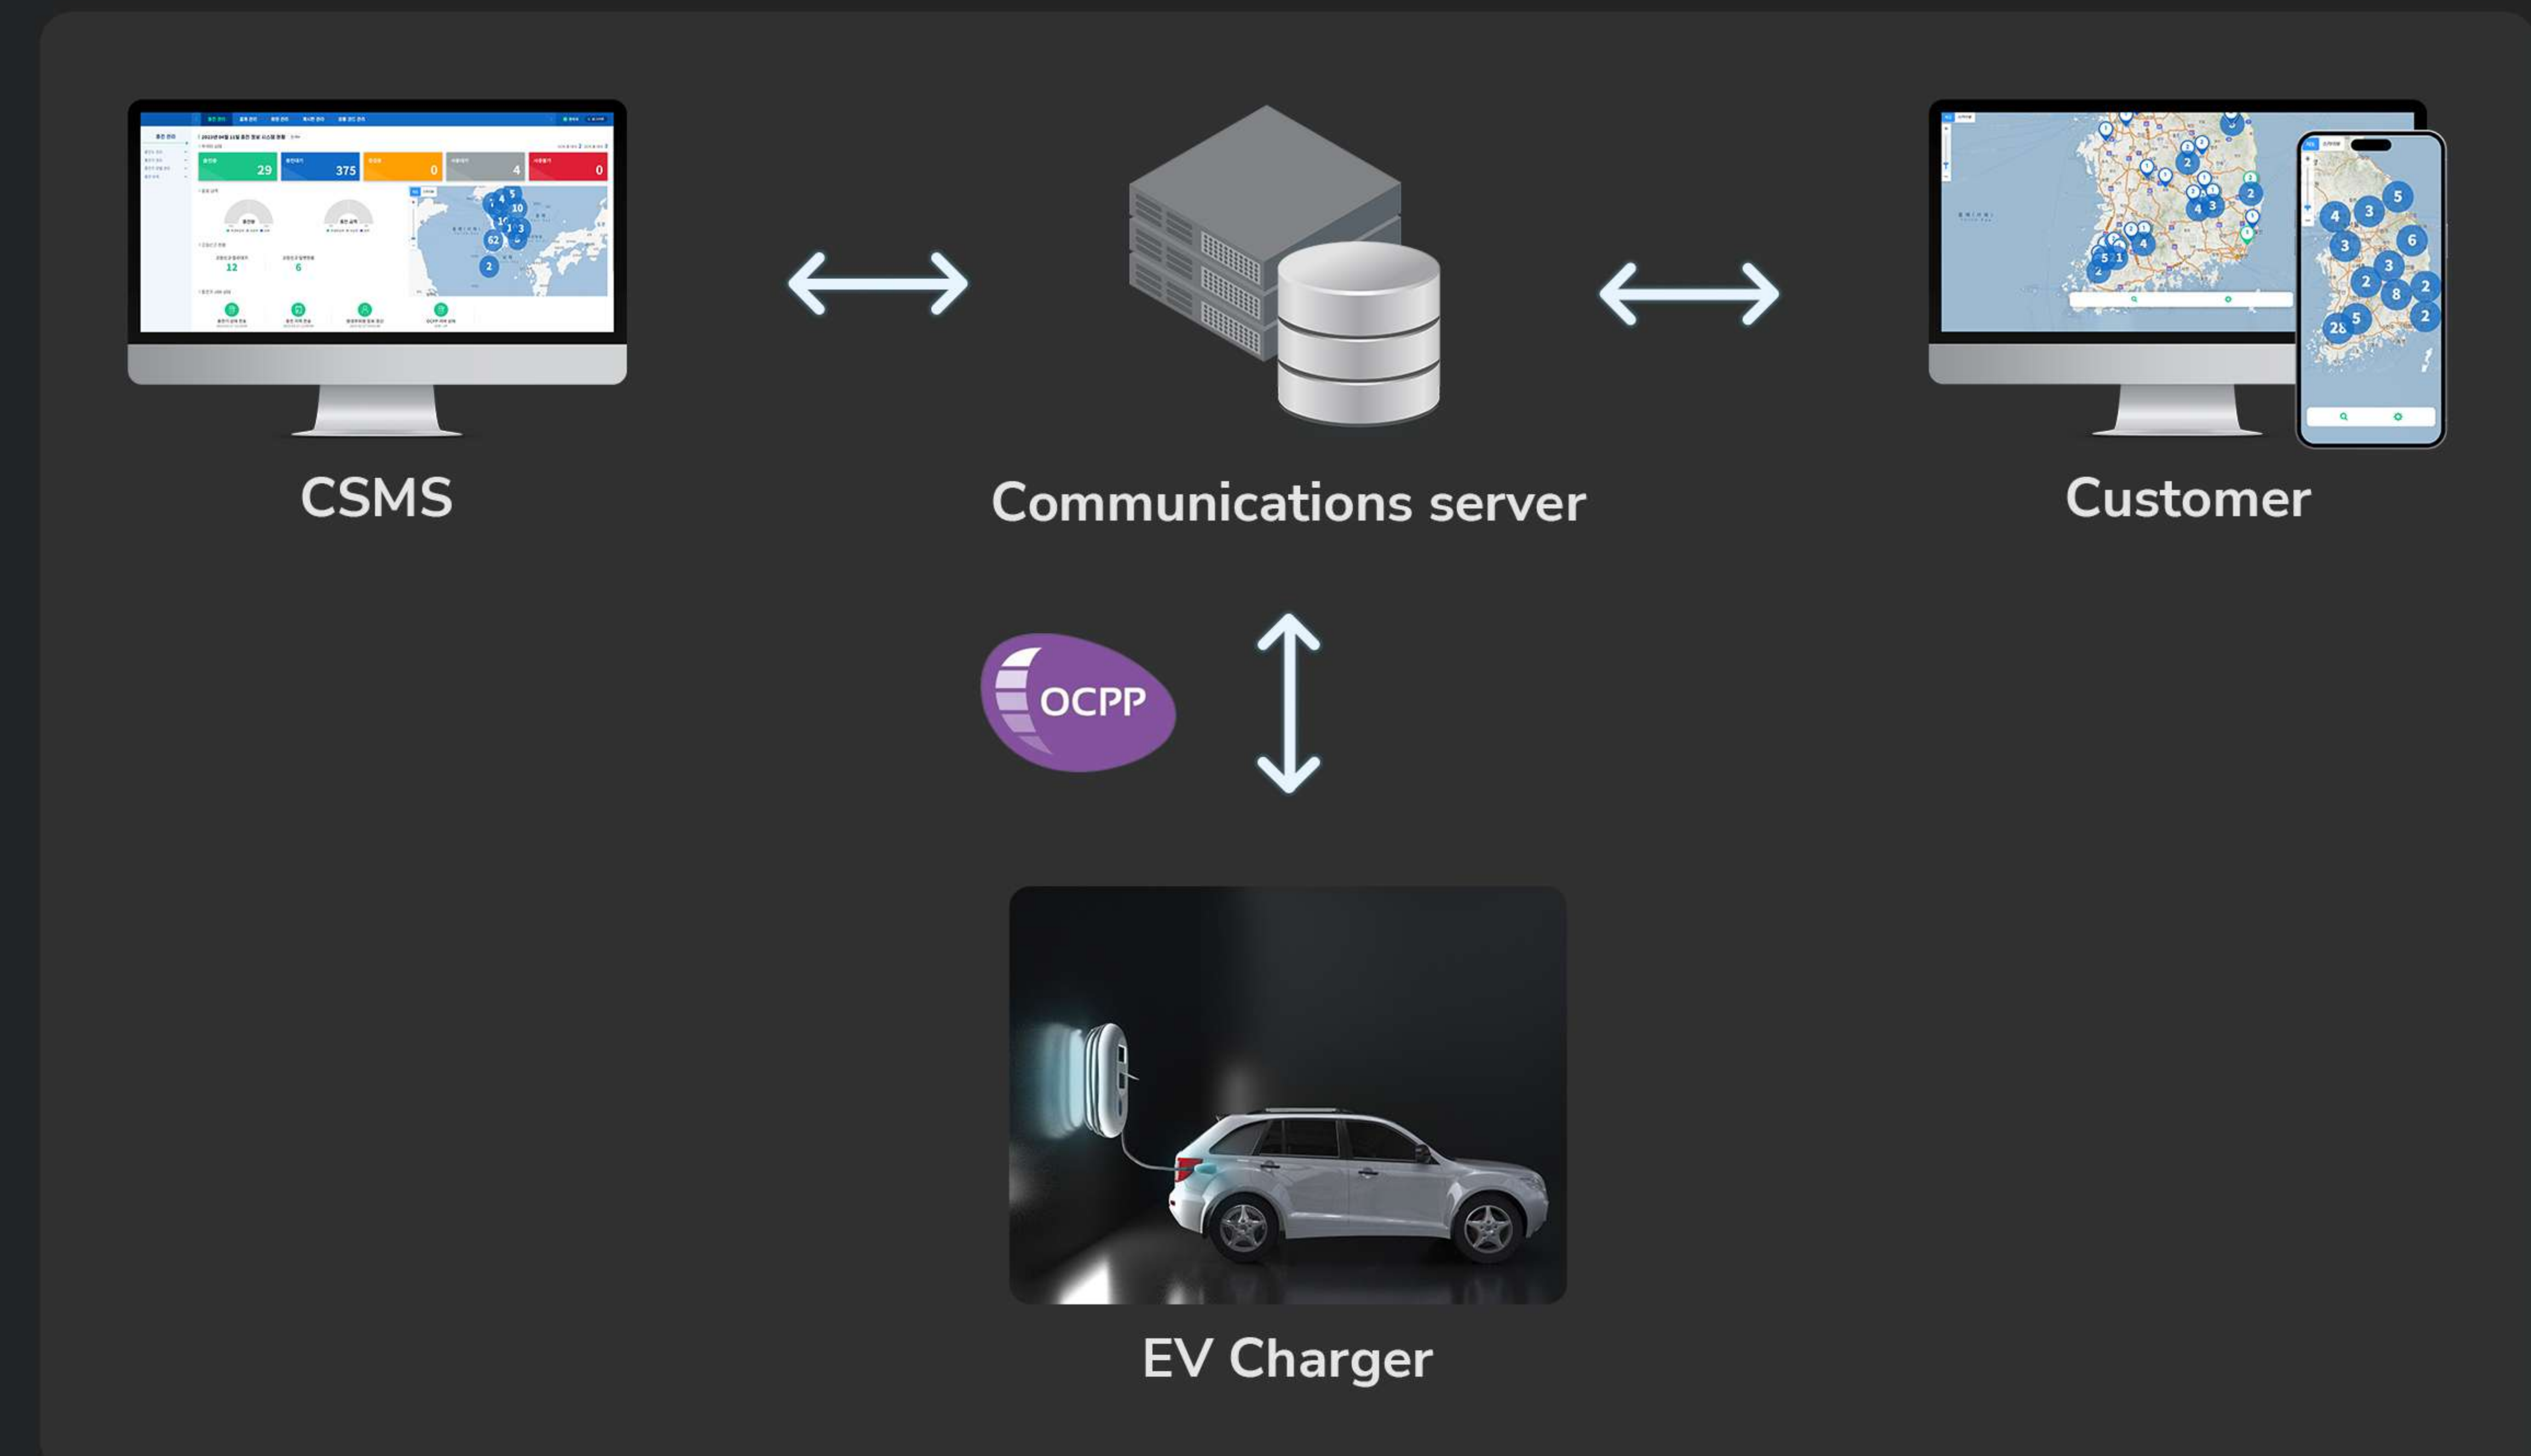

Main function

- Convenient access with web-based services
- Measurement of charger usage prevents overload and accurately calculates billing
- Convenient payment method (membership card, simple payment, members of the Ministry of Environment, roaming payment)
- Connecting data from the Ministry of Environment (integrated website of pollution-free vehicles*) on charger use and charger status information
- Provides GIS-based charging station location and charger status information
- Provides customer support services such as charger statistics and simple payment registration
- Electric vehicle charger remote control function

CSMS Communications server

- OCPP (Open Charge Point Protocol) 1.6 protocol-based communication
- OCPP standardizes communication between chargers and servers, ensuring compatibility between chargers and servers from different manufacturers and ensuring scalability of EV charger control systems
- This optimizes the operation of electric vehicle chargers to provide more convenient charging services for electric vehicle users
